

Simplewp

Note: This is just a bunch of hackish scripts that happen to work for me. I am not interested in this particular project anymore.

1 Description

Simplewp is a suite of tools that can be used to build entire static websites from “almost plain text” files in the reStructuredText format¹. This makes it very easy to focus on the content rather than on a language syntax. The same content can be compiled into different formats (html, pdf, plain text). This web site was built entirely using simplewp.

2 Features

- Can build an entire static website
- Can generate PDF, html or plain text files, and make the web page link to the alternative versions
- Support math equations using the latex syntax
- Support translations
- Released in the Public Domain

3 News

3.1 February 4th 2010: version 20100204

Initial release.

4 Download

Simplewp is available both as a Pacman² package (x86_64 only), or in source form. For source or Pacman installation, please refer to the Generic download and install instructions³.
